

TECHNIDOCK  Proudly Introduces..

TECHDECK

What is composite decking? Plastic and wood fibers are mixed together and melted to create a decking material. The best composites are those manufactured with fine wood sawdust so that the plastic can protect (encapsulate) each fiber.

- Virtually Maintenance Free - no yearly weatherproofing or staining required
- Natural Wood Look
- Resistant to Insects, Moisture, Mildew & Rot
- Won't Warp, Check or Split
- Fastener Free Deck Clip System
- Available in Cedar, or Grey Color

Why not a totally plastic or wood deck? Composite combines the best features of each material; plastic keeps moisture out of the wood, and wood helps control the contraction and expansion of the plastic.

Why buy Techdeck Composite Decking over other products?

- It's the most natural looking composite decking on the market
- Reversible product - brushed on all sides
- No special tools required - standard carpentry tools are all that's needed
- Matches pressure-treated, cedar and redwood lumber
- Surface is cooler than most other composites and heavy wood grain finish is slip resistant

Withstands marking and stains better by simply wire brushing and/or washing with a standard detergent or composite deck cleaner
